H

Opening Wedge Osteotomy

Opening Wedge Osteotomy
The Arthrex Opening Wedge
Osteotomy System was developed
for the treatment of pain and/or
instability associated with lower
extremity malalignment. The
utilization of the unique plate, in
conjunction with a medial opening
osteotomy, provides the surgeon with
a safe, reliable, reproducible
technique for proximal tibial and
distal femoral osteotomies.
The opening wedge technique offers
a number of distinct advantages over
traditional closing wedge techniques,
including: a single saw/osteotome
cut, smaller incision with minimal
soft tissue disruption, higher degree
of precision, maintains normal
anatomy, no fibular disruption, no
peroneal nerve morbidity and biplane correction possible.
